FOREWORD

This publication is the Software Maintenance Manual for the Exploratory Systems Control Model (ESM). The software described is contained on four system tapes. Book 1 contains description, flowcharts, and listings for programs written in FORTRAN. Book 2 contains description, flowcharts, and listings for programs written in MDMPL Assembly Language. This manual was prepared by the Burroughs Corporation and is submitted in accordance with the requirements of contract DCA100-75-C-0054.

Introduction

The ESM system software is contained on four TU10 Magtapes. Tape #1 contains the source, object, task, overlay description language, message, system, ATEC simulation, and command files used for the User Language, Record Move Utility, and Interprocess Communication and Resource Sharing Demonstration Programs for host processors A and B. Tape #2 contains microcode source and object files for loading the eleven B7* CIE microprocessors, and the microcode loader utility (ESMLDR). Tape #3 contains the task, source, object, and overlay description language files for the Mini-D Micro Programming Language (MDMPL) Assembler. Tape #4 contains the ESM Diagnostic Library.

References for the FORTRAN language used include the Digital Equipment Corporation documents PDP-11 FORTRAN Language Reference Manual (DEC-11-CFLRA-C-D) and IAS/RSX-11 FORTRAN IV User's Guide (DEC-11-LMFUA-C-D). It is also assumed that the reader is familiar with the PDP-11 RSX11M operating system (Version 2) including MCR commands (Reference - RSX11M Operator's Procedures Manual - DEC-11-OM06A-B-D) and the utilities EDI, FLX, and PIP (Reference - RSX11M Utilities Procedures Manual - DEC-11-OMOGA-B-D).

References for the MDMPL Assembler include Appendix A of this manual which provides B7* programming information, Appendix B of the manual which provides an MDMPL Instruction List, and Section 4.6 of the ESM User's Manual which describes Assembler use, CIE Instruction Functions, and programming examples.

In general, FORTRAN programs are stored in UIC [20,20], CIE Microcode programs are stored in UIC[1,20], and Diagnostics are stored in UIC[1,4]. System Tape Directory Listings are presented below.

2. MDMPL Microcode Programs

2.1 NCU Microcode

The program running in the Nodal Control Unit (B7*) is contained on three PROM chips. This program is not alterable by user personnel. Note that the program listing uses hexadecimal notation for memory program address (MPAD) and 12-bit instructions.

The operation of the NCU may be described by the three-state diagram shown in Figure 2-1. The NCU is always in one of three states; namely: Read, Wait or Write. The state transitions and their causes follow:

1. Read-to-wait. This state transition occurs when a packet has been read into the input page of the NCU as indicated by the end-of-packet word (EOP). The NCU informs the CIE of this condition by setting the EXT of the CIE. The NCU then suspends operation by waiting for its EXT to be set. The read-to-wait transition is unconditional.
2. Wait-to-read. The CIE determines the type of packet in the input page. If the packet is neither a WT nor a receive/ send type, the CIE sets the mailbox for read and sets the EXT of the NCU. The NCU then comes out of the Wait state and goes into its Read mode.
3. Wait-to-write. The CIE determines the type of packet in the input page. If the packet is a WT or a receive/send type, the CIE sets the mailbox for the type of write and sets the EXT of the NCU. The NCU then comes out of the Wait state and goes into the Write state.
4. Write-to-read. This transition occurs unconditionally after write is complete.

The software modules of the NCU are written to correspond to the three states; a functional description follows:

1. Read. The LIU address register is set to the read address given in the mailbox page (Figure 2-2.) When the nodal logic senses an address word that is equal to the read address, the information word that follows is read into the input page and the B-register of the NCU. The data words are read into sequential locations of the input page until the EOP (all ONES) is sensed in the B-register by an IF ABT command in the read loop of the NCU program. The information word following the EOP is also read. This is the longitudinal parity check (LPC) word. Exit to the read-to-wait routine is then performed wherein the EXT of the CIE is set and the Wait state is entered by a looping IF EXT instruction.

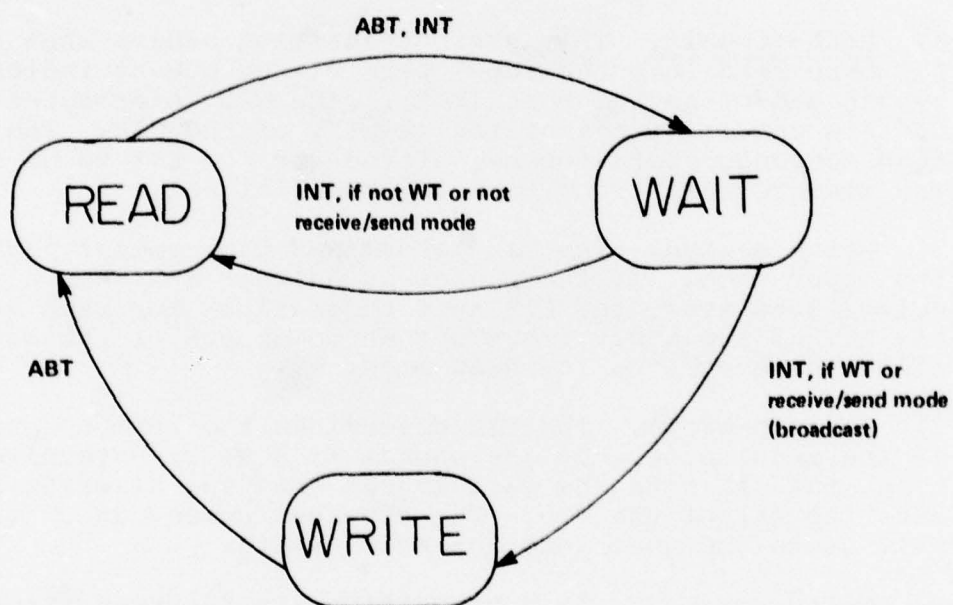

Figure 2-1. NCU State Diagram and Software Module

Figure 2-2. Mailbox Page Description

2. Wait. This module allows the CIE and NCU to access the same data pages. The NCU dwells in this state until its EXT is set. When an interrupt does occur, the NCU examines the mailbox page to determine what type of interrupt has occurred. The possible interrupts are Read, Write 0, or Write 1,2.

3. Write. If a Write 0 interrupt from the CIE has occurred, the NCU writes the data words of page 0 with the proper address field indicated on its mailbox page until an EOP character is found. For a Write 1,2 interrupt, the NCU first writes any ACK type packets that may reside on page 1 and then writes the output packet residing on page 2, if any, followed by a write token sent to the next node on the loop.

2.2 CIE Microcode

The CIE software that implements address-directed protocols is definable as a set of ten modules sequenced as shown in Figure 2-4. Modules on the left have higher selection priority than those on the right. This provides the quickest NCU wait-to-read transitions which must be performed rapidly to ensure that no message destined for a node is missed owing to late transition to the Read state. A short functional description for each module follows.

1. Background Module. The CIE scans the events that are to be processed. If none is present, the CIE looks for an empty external input buffer (for transfer of data to external equipment - such as host or user terminal, or in the case of gateway nodes another CIE). It loads the external buffer from input queue if a packet is present. It looks for an EXT interrupt from the interface buffer. It also handles the generation of new WT's and checks packets in the output queue for retransmission timeout.

2. Node Controller. An NCU event occurs only upon completion of an NCU read-to-wait transition. The NODE CONTROLLER moves the packet on page 0 to an empty page in CIE memory and links the page to input queue. The header is then examined. For ACK, NAK or input messages the NCU READ INTERRUPTER is started immediately with one exception; namely: the message is a nodal control message. In that case, one of the following is performed first.

- Write mailbox to change hardware (read) address;
- Change logical-ID/functional address table;
- Write mailbox to change WT address.

If the input packet is of the receive/send type then the NCU WRITE 0 INTERRUPTER is started. If the input packet is a WT then the output queue handler is started.

3. NCU Read Interrupter. The read mailbox is set and the EXT of the NCU is set to cause a wait-to-read transition. For ACK/NAK inputs, the OUTSTANDING ACK HANDLER is called, otherwise the CIE TO INPUT QUEUE HANDLER is called. If the node is a gateway node, ACK/NAK inputs are treated as regular input messages destined for another loop.

4. NCU Write 0 Interrupter. The Write 0 mailbox is set and the EXT of the NCU is set to cause a wait-to-write transition. The CIE TO INPUT QUEUE HANDLER is then called. Thus a receive/send message is treated as both an input and an output message.

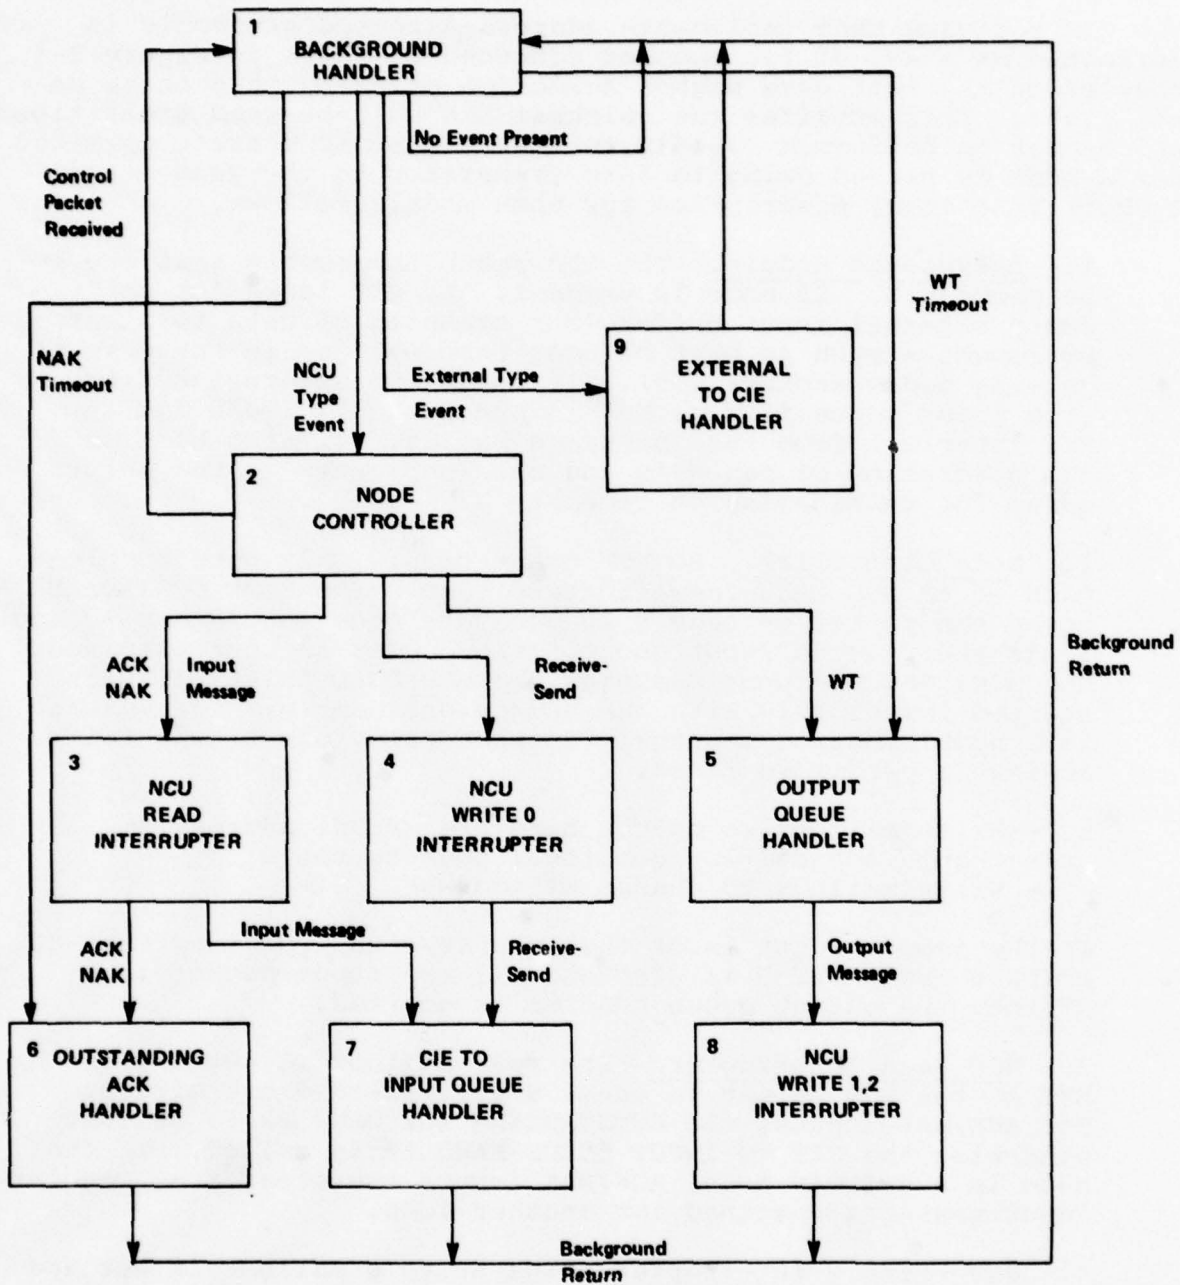

Figure 2-4. CIE Software Manual

5. Output Queue Handler. After a WT has been received, all extant output ACK/NAK messages are moved to the mailbox. An output message (if any) is then delinked from Output Queue and moved to the NCU page 2. The NCU WRITE 1, 2 INTERRUPTER is then called.

6. Outstanding ACK Handler. An ACK received is paired to a packet previously written to the line and the packet page is marked available. A NAK received is paired to a previously written page and the page is relinked to the Output Queue for retransmission. At the end of the Outstanding ACK module, return to the Background module is performed.

7. CIE to Input Queue Handler. All input packets are handled by this module except ACK/NAK packets received at local nodes and WT packets. Input message and receive/send packets are checked for parity. If parity checks, the packet is linked to Input Queue and an ACK is added to the extant output ACK/NAK list. If parity does not check, the packet is marked null and a NAK is added to the extant ACK/NAK list. The Background module is then called.

8. NCU Write 1, 2 Interrupter. The Write 1, 2 mailbox is set. The destination for WT and the output message write address are set into the mailbox. The EXT of the NCU is then set, and the Background handler is called.

9. External to CIE Handler. If an external to CIE event exists, the CIE transfers the content of the CIE buffer to the Output Queue for messages and the CIE buffer is marked empty. In gateway nodes, ACK/NAK packets may also be sent across the external interface. When received, such ACK/NAK messages are placed in the extant ACK/NAK list for transfer to the NCU at the next used Output Queue Handler. The background module is then called.

The CIE program listings use octal notation for memory program address and 12-bit instructions. CIE source and object microcode files reside on ESM Tape #2. Although object files are given for the 11 ESM nodes, only four source files are given for the four types of nodes. These four source files can be used to generate object files for all nodes in the system as described below.

The source files given correspond to a host type node (HST5.DAT), CRT type node (CRT4.DAT), and a gateway type node (GAT7.DAT). In addition a special source file (HST9.DAT) is listed for the loop 3 host node having node designator 9. The node is currently connected to a modem which connects a Texas Instrument's Silent 700 terminal residing in Paoli, Pa. via a leased line to the ESM. Eventually this node will be used as a gateway node connecting the present 3-loop ESM to a fourth loop being developed under the Exploratory System Control Model Development (ESMD) contract. Thus the listing for HST9.DAT is a preliminary version which will change; further documentation will be presented at the end of the ESMD contract.

Since the programs for the three node types (HOST, CRT, GATEWAY) are very similiar, a complete set of flow charts is presented for HST5.DAT only. The other two programs are flowcharted only where they differ from HST5.DAT. CRT4.DAT is the same as HST5.DAT in modules 0-INIT, 2-CONT, 3-INTRD, 4-INTO, and 5-OUTQ. CRT4.DAT is different from HST5.DAT in the following modules:

1-BACK: Replace code between connections B1 and WTTM.

6-OUTAK: Replace code between connectors NNACK and KLLPAC.

7-INQ: Replace IQLINK.

8-INT1-2: Add B2.

9-EXXCIE: Completely different

Add subroutines LKOTB, LKINB.

GAT7.DAT is the same as HST5.DAT in modules 0-INIT, 2-CONT, 3-INTRD, and 4-INTO. They are different in the following modules:

1-BACK: Delete PAKOUT

5-OUTQ: Replace C1 until end of module.

6-OUTAK: Delete entire module.

7-INQ: Replace code between connectors A7 and CSTPP.

8-INT1-2: Add B2.

9-EXXCIE: Insert C2. Replace code at LNKOQ until END.

Add Subroutine AKMVR.

The eleven object files differ in the VALUE statement parameters which appear in the beginning of the program. These parameters are the node's own logical-ID (VOLID) which equals the node designator, read address (VRDA), write token address (VWTA) which equals the write address (VWRA), and maximum number of clock ticks for write token regeneration (VDFFWT). The values used for the eleven nodes are given in Table 2-1.

Table 2-1. CIE Nodal VALUE Parameters

<u>NODE TYPE</u>	<u>VOLID</u>	<u>VRDA</u>	<u>VWRA V. WTA</u>	<u>VDFFWT</u>
HST	1	1	3	7
GAT	2	2	1	4
GAT	3	3	2	12
CRT	4	4	2	12
HST	5	2	1	7
GAT	6	1	3	6
GAT	7	3	4	4
CRT	8	4	3	12
HST	9	3	2	14
GAT	10	2	1	4
GAT	11	1	4	7

There are additional variations for the Logical-ID/Functional Address Conversion Table memory page (Page 1) for the three loops. This page is loaded in the O-INIT module after label INRP5. These values are given in Table 2-2.

Table 2-2. LID/FAD Conversion Table

<u>LID's</u>	<u>1</u>	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>	<u>6</u>	<u>7</u>	<u>8</u>	<u>9</u>	<u>10</u>	<u>11</u>
FAD's Loop 1	1	2	3	2	2	2	2	3	3	3	3
FAD's Loop 2	1	1	1	4	2	3	1	3	3	3	3
FAD's Loop 3	1	1	1	2	2	2	2	4	3	2	1

Host and CRT type nodes which originate messages use alternate routing indicators VALT0 and VALT1. Nodes in loop 1 have VALT0=2 and VALT1=3, nodes in loop 2 have VALT0=1 and VALT1=3, and nodes in loop 3 have VALT0=1 and VALT1=2. ESM Tape #2 also contains object files for low speed modeling (ending in "L"), and host A (loop 1) dialogue director (ending in "S"). Since low speed operation results in CIE clock tick periods of approximately 3 seconds, the packet retransmission parameter (VMAXCK) value 41 used for the high and medium speed code results in excessively long waits for packet retransmission. Thus object files HST1L, CRT4L, HST5L, and CRT8L use a VMAXCK value of 5 for a 15 second packet retransmission time. Files CRT4S.OJB and CRT8S.OBJ are used for selecting host processor A (loop 1) as primary dialogue director for the terminal. The Logical-ID for the primary dialogue director is given by VPDDLID and the secondary dialogue directory by VADDLID. Logical-ID 1 is used for host processor A loop 1, and Logical-ID 5 is used for host processor B loop 2. CRT4.OBJ and CRT8.OBJ use VPDDLID=5, VADDLID=1, and CRT4S.OBJ and CRT8S.OBJ use VPDDLID=1, VADDLID=5.

2.3 Diagnostics

This section describes the diagnostic programs supplied with the ESM. These programs provide the capability to verify proper operation of the ESM or to verify that a fault exists. They also permit isolation of a fault to a specific hardware element.

The procedure for loading the diagnostic(s) is as follows:

1. Mount Diagnostic Tape (#4) on Tape Transport of Host Processor B (connected to Loop 2).
2. At DECscope, do the following:
 - Set User Identification code to Access File by entering SET /UIC = [1,4]
 - Move object file to disk. FLX DKO:/FB:256. = MTO: file.OBJ
 - Load object file into suspect node(s)' CIE's.
RUN [20,20] ESMLDR
Enter filename.
3. At ESM cabinet:
 - Set LD/EN Switch to Up position
 - Set Selected Node LOAD Switch to Up position
 - Depress M-CLR pushbutton.

4. At DECscope: Press Carriage Return key to initiate loading.

NOTE: It is possible to load nodes in different loops simultaneously but not nodes within the same loop.

5. At appropriate ESM cabinet and node:

- Reset Node LOAD Switch (Switch Down)
- Reset LD/EN Switch (Switch Down)
- Run diagnostic using ESM Monitor.

Note: When loading with Monitor plugged-in, Monitor must be in Run mode.

The following paragraphs identify the various diagnostic programs and describe their application to the ESM:

1. Memory Checking Program

Source file MEMCK.DAT
Object file MEMCKO.OBJ

Purpose: For checking NCU and CIE data memory boards.

Description: The bit patterns 10101010, 01010101 and sequential numbers are written into memory and read out again for all NCU and CIE memory pages. If all checks pass the program hangs at location NOERR. If there is an error in the NCU data memory the program hangs at the NCUERR. If there is an error in the CIE data memory the program hangs at CIEERR. The operator may then single step the program to find the word and page number where the test failed and examine the contents of the bad page. There are a total of 44 CIE pages, 16 each on the first two CIE memory cards and 12 on the third card. Thus, a failure on page 16 would indicate a problem on the second data memory card.

2. Block Transfer Diagnostic

Source file BLKS.DAT
Object file BLOUT.OBJ

Purpose: For checking memory reading and writing and block transfers between NCU and CIE ancillary boards.

Description: This program loads page 0 of the NCU with sequential numbers, reads them from the CIE and then block transfers page 0 of the NCU to page 3 of the CIE. The result of the transfer is then read and the program hangs at location NG1 on failure to

read sequential numbers. The program then loads CIE page 6 with sequential numbers, reads the data and then block transfers to page 2 of the NCU. The result of the transfer is then read and the program hangs at location NG2 on failure. The program hangs at HANG5 if there are no failures.

Special Instructions: The NCU must be in a "Don't EXECUTE" state so that it may not modify its data memory.

3. Gateway Debug Diagnostic

Source file GTB.DAT
Object file GTBO.OBJ

Purpose: To check gateway interfaces between two cabinets.

Description: The program is loaded into gateway nodes in two loops. One gateway sends sequential numbers to the other gateway which reads the result. The sending gateway loads CIE page 0 with sequential numbers, sends the page across the interface and then may read the original page, if required. The reading gateway code starts at octal location 40. It block transfers the output buffer contents to CIE page 1 and reads the results.

4. CRT-to-CRT via Gateway Diagnostic

Source files CTCC.DAT
CTCG.DAT
Object files CTCCO.OBJ
CTCGO.OBJ

Purpose: For checking in loops #2, #3 gateway interface, partial loop (node) verification, and CRT interfaces.

Loading Instructions: Object file CTCCO.OBJ is loaded into CRT nodes on loops #2,3. Object file CTCGO.OBJ is loaded into gateway node GB in loop #2, and gateway node GA in loop #3. Put other nodes into DNEX and CLEAR state via panel-mounted switches while running diagnostic.

Description: These programs accept a packet from a CRT, send the packet via the loop to a gateway node, transfer the packet across the interface, and then deliver the packet to the CRT via the loop. After hitting the master clear and loop clear, acceptable operation allows a packet to be transmitted from one CRT to the other CRT connected to the other loop. Messages may be sent in either direction. A terminal that is in local mode will beep when there is a packet to be received.

5. CRT Interface Diagnostic

Source file CRTCK.DAT
Object file CRTOBJ.OBJ

Purpose: For checking CRT interface boards and TD802 CRT operation.

Description: This program accepts a packet from the CRT and then resends the packet back to the CRT preceded by 7 line feeds. The operator types a packet (up to 3 lines), transmits the packet and proper operation results in the packet being displayed on the bottom part of the screen.

6. PDP-11 Interface Diagnostic

PDP-11 files: Source PDP.FOR
(listed in Object PDP.OBJ
Section 1.7.1) Task [1,4] PDP.TSK

CIE files: Source PDP.DAT
Object PDPO.OBJ

Loading: Load the PDP-11 connected CIE's with PDPO.OBJ. Run the CIE connected B7*. Run the task on the PDP-11 to be tested; i.e., RUN [1,4] PDP.TSK.

Purpose: This program checks the M1710 PDP-11 interface and the Host Interface Board. A three-line-packet is entered on the DECWRITER. The CIE hangs (at HNG1) after receiving the packet, and memory page 20 can be examined by single-stepping. The packet may then be written back to the DECWRITER by running the program from location WRTB.

7. Loop Check Diagnostic

Source file LPCK.DAT
Object file LPCKO.OBJ

Purpose: For checking reading and writing ability of Loop Interface boards, loop operation, and Clock-Retimer operation.

Description: This program contains the code for writing a packet of sequential numbers to the loop and for reading the packet from the loop. For a successful read the program hangs at location NOERR. For an unsuccessful read the program hangs at location ERROR where the word location and data of the bad read can be examined.

Operating Procedures: For each loop, one node is designated the writer and one node the reader. For the writer, toggle in two STEP (hex 187) instructions at octal addresses 16 and 17. Put other two nodes into DON'T EXECUTE, CLEAR state. To run the test clear the loop, clear the reader, and then clear the writer. The reader will then halt at location ERROR or NOERR depending on the outcome of the test.

8. Extended Gateway Debug Diagnostic

Source file GTBA.DAT
Object file GTBOA.OBJ

This program performs the same function as the GTBO gateway diagnostic except it is extended so that received packets (having sequential numbers) are checked automatically for errors.

9. Silent 700 Terminal Diagnostic

Source file TI.DAT
Object file TI.OBJ

Purpose: To check the operation of the Silent 700 Terminal, the terminal interface board- and the leased line and modems.

Description: This program provides a loop-back capability for the remote terminal. A message typed on the terminal followed by a carriage return is received by the CIE and sent back to the terminal so that a copy of the transmitted message is received.

APPENDIX A
B7* PROGRAMMING MANUAL

Appendix A. B7* Programming Manual

This appendix describes the operation of the B7* microprocessor and serves as a programming manual.

2.

PRODUCT DESCRIPTION

THE B7+ CONSISTS OF TWO L-PROFILE PRINTED CIRCUIT CARDS CONTAINING 65 TTL CHIPS, INCLUDING AN OPTIONAL 256 WORDS OF MICRO PROGRAM MEMORY. DATA PROCESSING IS PERFORMED IN 8-BIT BYTES, I.E., EACH INSTRUCTION OPERATES ON 8 BITS OF DATA.

2.1

FUNCTIONAL ORGANIZATION

THE FUNCTIONAL ORGANIZATION OF THE B7+ MICRO-COMPUTER IS SHOWN IN FIGURES 1 AND 2. THE FUNCTIONAL ELEMENTS ARE DESCRIBED BELOW:

2.1.1

MICRO PROGRAM MEMORY (MPM)

~~THE MICRO PROGRAM MEMORY CONSISTS OF AN OPTIONAL 256 WORDS (12 BITS EACH) OF ROM MEMORY WHICH ARE PLUGGED INTO SOCKETS PROVIDED ON THE P.C. CARDS. ADDITIONAL EXTERNAL PROGRAM MEMORY CAN BE ADDED AS REQUIRED UP TO 65K WORDS. MPM PARITY CHECKING, IF REQUIRED, MUST BE PERFORMED EXTERNALLY.~~

2.1.2

MEMORY CONTROL UNIT (MCU)

THE MEMORY CONTROL UNIT CONTROLS THE ADDRESSING OF PROGRAM MEMORY. CONTAINED IN THIS AREA ARE THE MPCR (MICRO PROGRAM COUNT REGISTER) AND THE AMPCR (ALTERNATE MICRO PROGRAM COUNT REGISTER). MPCR CONTAINS THE ADDRESS OF THE CURRENT MPM LOCATION BEING ADDRESSED. AMPCR USUALLY CONTAINS A JUMP ADDRESS FOR RETURN FROM SUBROUTINES, BUT WHEN NOT REQUIRED FOR THIS PURPOSE, AMPCR CAN BE USED BY THE LOGIC UNIT AS A SCRATCH PAD REGISTER.

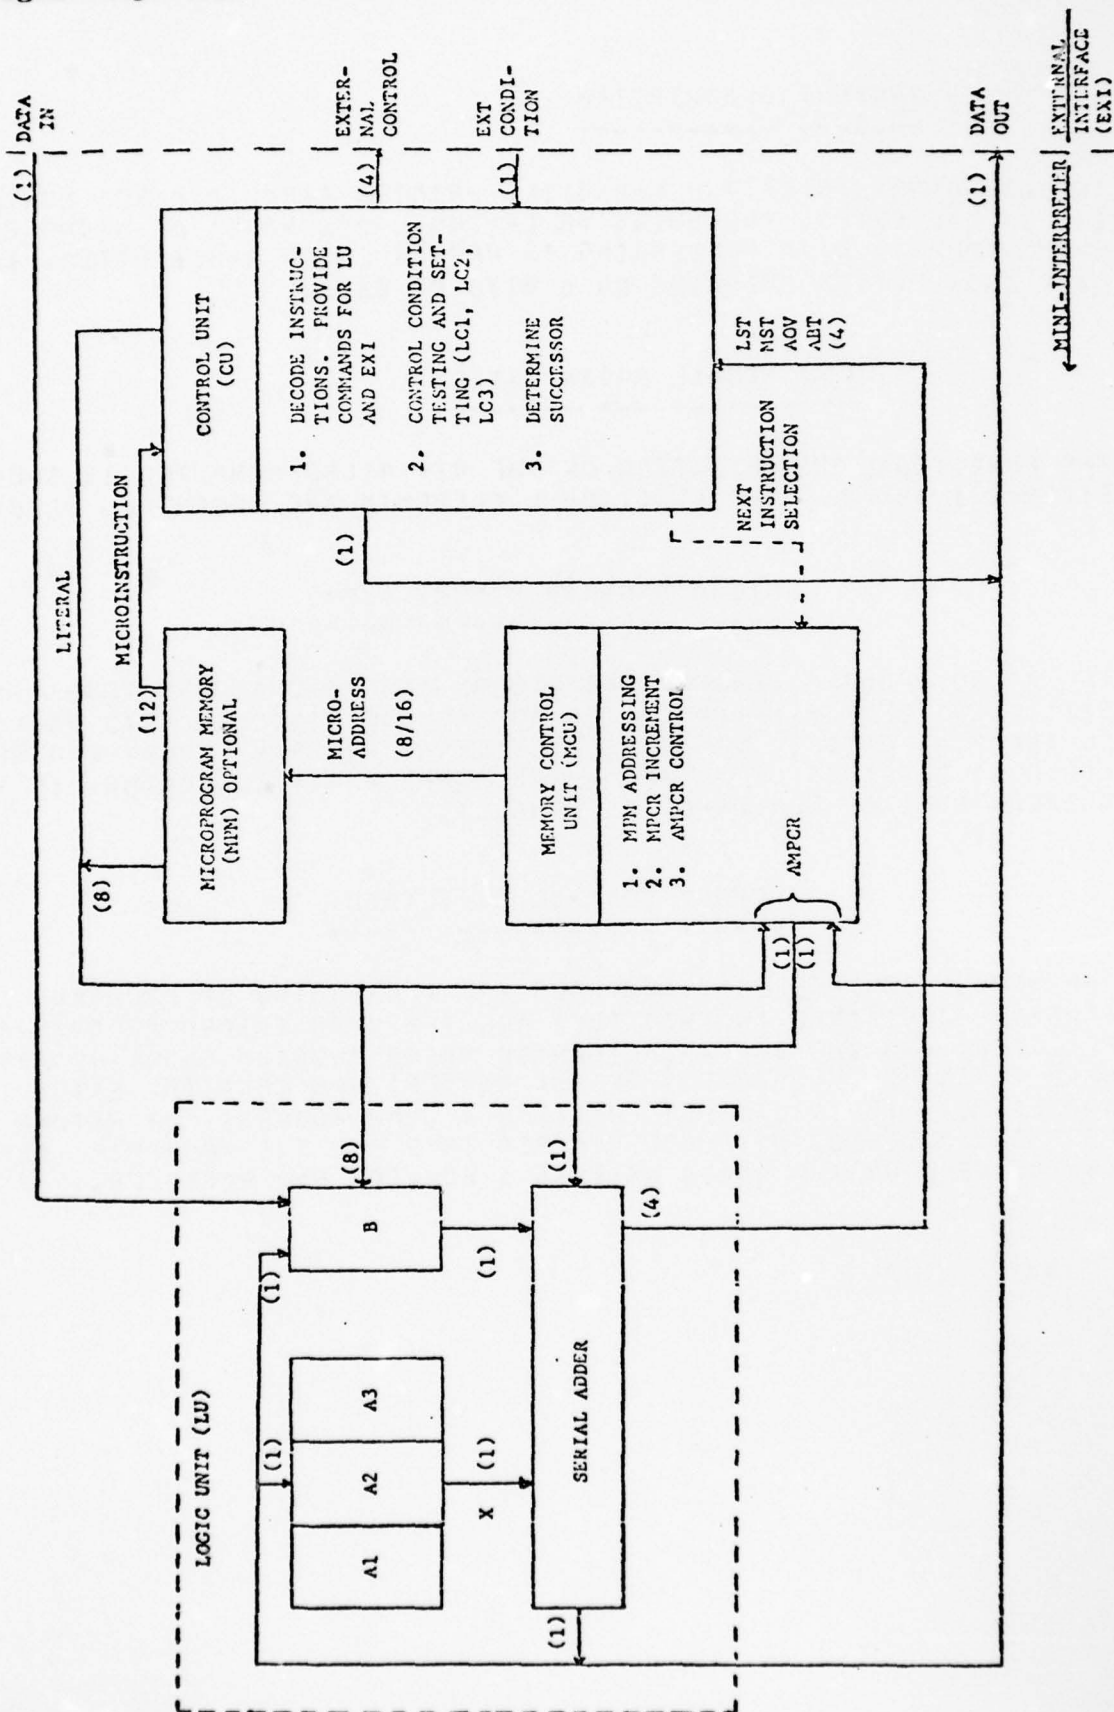

FIGURE 1. B7* GENERAL BLOCK DIAGRAM

FIGURE 2. GENERAL PURPOSE BLOCK DIAGRAM

2.1.3

CONTROL UNIT (CU)

THE CONTROL UNIT PERFORMS CONDITION SELECTION AND TESTING, SUCCESSOR DETERMINATION, INSTRUCTION REGISTER DECODING, AND TIMING CONTROL AS DESCRIBED BELOW:

2.1.3.1

CONDITION SELECTION AND TESTING

THIS LOGIC SERVES THE FOLLOWING PURPOSES:

1. THE ADJUSTMENT AND TESTING OF LOCAL CONDITION FLIP-FLOPS (LC1, 2, 3). THESE FLIP-FLOPS ARE USED AS REQUIRED BY THE PROGRAMMER.
2. THE EXTERNAL INTERRUPT INPUT (EXT) IS USED BY AN EXTERNAL SOURCE TO PROVIDE A SOFT INTERRUPT TO THE PROCESSOR.
3. THE ARITHMETIC LOGIC UNIT (ALU) OPERATION CONDITION FLIP-FLOPS ARE USED TO RECORD THE ADDER OUTPUT RESULTS OF THE LAST LOGIC UNIT OPERATION (LOOP), AS FOLLOWS:

FF	MEANING WHEN SET
--	-----

LST	LEAST SIGNIFICANT BIT WAS TRUE.
-----	---------------------------------

MST	MOST SIGNIFICANT BIT WAS TRUE.
-----	--------------------------------

AOV	THE OPERATION RESULTED IN AN ADDER OVERFLOW (MOST SIGNIFICANT CARRY).
-----	---

ABT	THE OPERATION RESULTED IN AN ALL-ONES OUTPUT FROM THE ADDER.
-----	--

2.1.3.2

SUCCESSOR DETERMINATION

THE SUCCESSOR DETERMINATION LOGIC IS USED DURING A CONDITION TEST OPERATION (CTOP). ALL OTHER OPERATIONS RESULT IN AN UNCONDITIONAL STEP. THE POSSIBLE SUCCESSORS ARE STEP, JUMP, SKIP2, OR EXECUTE AND ARE BASED UPON THE CONDITION SELECTED BY THE CTOP INSTRUCTION.

2.1.3.3

INSTRUCTION REGISTER (IR)

THE INSTRUCTION REGISTER IS A 12-BIT REGISTER AND IS LOADED WITH THE INSTRUCTION DATA READ FROM MPM. THE INSTRUCTION REGISTER CONTAINS THE INSTRUCTION CURRENTLY BEING PERFORMED WHILE THE NEXT INSTRUCTION IS BEING READ FROM MPM, THUS PROVIDING AN EXECUTE-FETCH-OVERLAP FEATURE.

2.1.3.4

INSTRUCTION DECODING

THE INSTRUCTION DECODING LOGIC DECODES THE CONTENTS OF THE INSTRUCTION REGISTER IN PREPARATION FOR INSTRUCTION EXECUTION. INSTRUCTION DECODING IS ACCOMPLISHED IN THE FIRST CLOCK PERIOD FOLLOWING THE INSTRUCTION REGISTER LOAD.

2.1.4

TIMING CONTROL

FIGURES 3, 4, AND 5 ILLUSTRATE TYPICAL TIMING SEQUENCES FOR VARIOUS B7+ INSTRUCTIONS. BASICALLY THERE ARE TWO TYPES OF INSTRUCTIONS: THOSE WHICH ARE PERFORMED SERIALLY (TYPE I) AND THOSE WHICH ARE PERFORMED IN PARALLEL (TYPE II). TYPE I INSTRUCTIONS INCLUDE LOGIC UNIT OPERATIONS AND LITERAL-TO-DEVICE OPERATIONS; ALL OTHER INSTRUCTIONS ARE TYPE II.

TYPE I INSTRUCTIONS REQUIRE NINE CLOCK PERIODS FOR COMPLETION. TYPE II INSTRUCTIONS REQUIRE THREE CLOCK PERIODS FOR DECODING AND EXECUTION PLUS AS MANY ADDITIONAL CLOCK PERIODS AS ARE REQUIRED TO FETCH THE NEXT INSTRUCTION. IN A TYPE I INSTRUCTION THE FETCH TIME OF THE NEXT INSTRUCTION IS OVERLAPPED BY THE SERIAL EXECUTION TIME OF THE CURRENT INSTRUCTION.

FIGURE 3 ILLUSTRATES THE TIMING OF LOGIC UNIT OR LIT-TO-DEVICE INSTRUCTIONS. AT TIME STROBE 7 AND CLOCK (CPIN) THE PREVIOUS INSTRUCTION IS COMPLETED AND THE NEW INSTRUCTION IS SIMULTANEOUSLY LOADED INTO THE INSTRUCTION REGISTER. THE INTERVAL OF TIME STROBE "P" (PPRESET) IS USED TO DECODE THE CONTENTS OF THE INSTRUCTION REGISTER IN PREPARATION FOR EXECUTION WHICH IS PERFORMED DURING TIME STROBES 0 THROUGH 7. UPDATING THE PROGRAM COUNTER (MPCR) IS ACCOMPLISHED AT THE CLOCK OF PRESET STROBE AND IS ALWAYS AN INCREMENT (STEP) FOR LOGIC UNIT OR LIT-TO-DEVICE INSTRUCTIONS.

IN SINGLE INSTRUCTION MODE THE B7+ WILL PERFORM ONE INSTRUCTION EACH TIME THE "RUN" LINE IS PULSED. THE INSTRUCTION BEING PERFORMED IS SUSPENDED IN THE LAST CLOCK PERIOD OF ITS EXECUTION. UPON RECEPTION OF THE NEXT "RUN" PULSE THE INSTRUCTION HELD IN SUSPENSION IS COMPLETED, A NEW INSTRUCTION IS LOADED INTO THE INSTRUCTION REGISTER, AND THAT INSTRUCTION IS PERFORMED UP TO THE

2.1,4

(CONTINUED)

TIMING CONTROL

FINAL CLOCK WHERE IT IS THEN HELD IN SUSPENSION AWAITING THE NEXT
"RUN" PULSE.

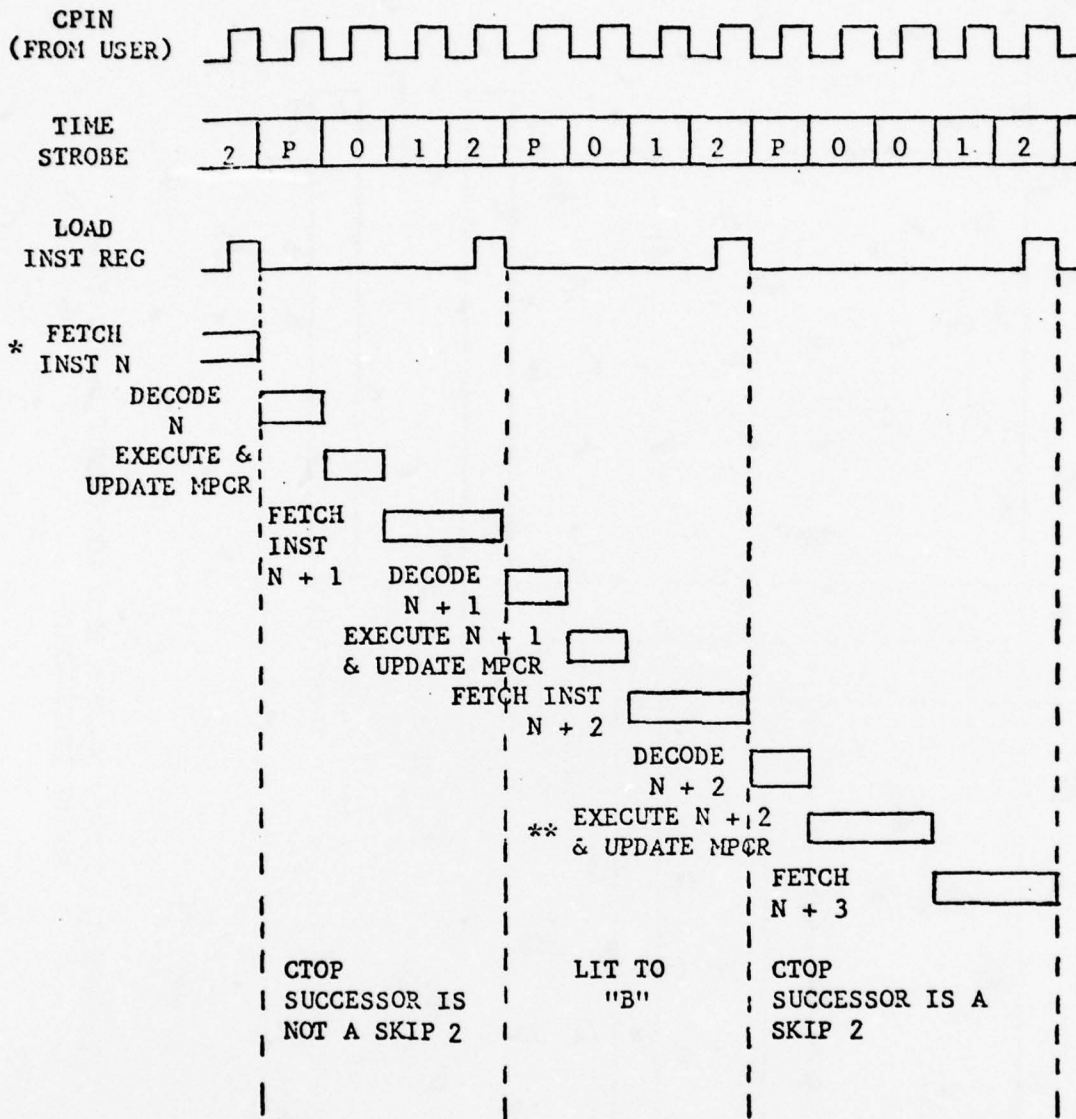

FIGURE 3. TIMING DIAGRAM OF A LOGIC UNIT OR LIT TO
DEVICE INSTRUCTION

* Fetch Time shown above is two clock periods as an example. The number of clocks actually required is a function of clock frequency and memory access time. The fetch time is presettable (by various insertions of 2 jumper wires) from 1 to 8 clock periods.

** This is a special case instruction. (CTOP resulting in a SKIP2 Successor) where additional time is required to update MPCR. This additional time (1 Clock) is acquired by suspending time strobe zero (TSB0) to span two clocks instead of one.

CONDITION TEST
INSTRUCTION

FIGURE 6. B7* INSTRUCTION SET

3. FUNCTIONAL DESCRIPTION

3.1 GENERAL

PROCESSOR OPERATIONS ARE CARRIED OUT BY THE SEQUENTIAL EXECUTION OF MICRO INSTRUCTIONS. EACH MICRO INSTRUCTION IS READ FROM THE PROGRAM MEMORY ON THE INSTRUCTION CYCLE PRECEDING ITS EXECUTION. THE EXECUTION OF EACH INSTRUCTION IS REGUN BY LOADING THAT INSTRUCTION INTO THE INSTRUCTION REGISTER. IN THE NEXT CLOCK PERIOD (PRESET STROBE) THE NEWLY LOADED INSTRUCTION IS DECODED. THE SUCCEEDING CLOCK PERIODS OF THE INSTRUCTION CYCLE WILL THEN BE USED TO EXECUTE THE DECODED INSTRUCTION. UPON COMPLETION OF THE EXECUTION PORTION THE NEXT INSTRUCTION WILL BE LOADED INTO THE INSTRUCTION REGISTER AND THE SEQUENCE DESCRIBED ABOVE IS REPEATED. FIGURE 6 DEFINES THE INSTRUCTION SET OF R7*.

AS SHOWN BY FIGURE 6, THERE ARE THREE CATEGORIES OF INSTRUCTIONS; NAMELY, LITERAL INSTRUCTIONS (PAR. 3.2), LOGIC UNIT INSTRUCTIONS (PAR. 3.3), AND CONDITION TEST INSTRUCTIONS (PAR. 3.4).

3.2 LITERAL INSTRUCTIONS

BITS 9 THROUGH 12 OF THE LITERAL INSTRUCTION ARE USED TO DECODE THE FUNCTIONAL OPERATION OF THE INSTRUCTION. BITS 1 THROUGH 8 REPRESENT A BINARY NUMBER ("LITERAL") TO BE LOADED INTO THE REGISTER AS SPECIFIED BY THE DECODING.

3.2.1 LIT-TO-DEVICE INSTRUCTIONS (DEVO, 1, 2, 3)

THE PURPOSE OF THIS INSTRUCTION IS TO TRANSFER THE LITERAL PORTION OF THE INSTRUCTION TO A PARTICULAR REGISTER IN THE USERS LOGIC. A LITERAL-TO-DEVICE INSTRUCTION IS DECODED WHEN INSTRUCTION BITS 11 AND 12 ARE BOTH ZERO. FURTHER DECODING (THAT OF DEVO, 1, 2, OR 3) IS DEFINED BY INSTRUCTION BITS 9 AND 10. THESE BITS ARE DECODED BY THE USER TO SPECIFY THE PARTICULAR REGISTER TO BE LOADED.

3.2.2

LIT-TO-IR, CALL, AND GOTO INSTRUCTIONS

3.2.2.1

LIT TO IR

--- -- --

THE LIT-TO-IR (LITERAL TO INSTRUCTION REGISTER) INSTRUCTION MUST PRECEDE THE CALL OR GOTO INSTRUCTION IF THE AMPCR AND MPCR ARE GREATER THAN 8 BITS WIDE. THE LIT-TO-IR INSTRUCTION IS USED TO LOAD THE MOST SIGNIFICANT BYTE OF THE GOTO OR CALL ADDRESS INTO THE INSTRUCTION REGISTER FOR TEMPORARY STORAGE WHILE THE CALL OR GOTO INSTRUCTION CONTAINING THE LEAST SIGNIFICANT ADDRESS BYTE IS FETCHED. THE CALL OR GOTO INSTRUCTION WILL LOAD ONLY INTO BITS 9 THROUGH 12 OF THE INSTRUCTION REGISTER THUS LEAVING INSTRUCTION REGISTER BITS 1 THROUGH 8 (MOST SIGNIFICANT ADDRESS BYTE) UNCHANGED AND THEREBY PERMITTING THE CONCATENATION OF INSTRUCTION REGISTER BITS 1 THROUGH 8 WITH MEMORY OUTPUT BITS 1 THROUGH 8 TO MAKE UP A 16-BIT CALL OR GOTO ADDRESS.

3.2.2.2

CALL

AS IMPLIED IN THE PREVIOUS PARAGRAPH A CALL INSTRUCTION WITH AN ADDRESS GREATER THAN 8 BITS CAN BE ACCOMPLISHED BY PERFORMING TWO SUCCESSIVE INSTRUCTIONS, NAMELY:

1. LIT-TO-IR (FETCH AND HOLD MOST SIGNIFICANT CALL ADDRESS BYTE).
2. CALL (FETCH LEAST SIGNIFICANT CALL ADDRESS BYTE AND EXECUTE CALL).

THE ADDRESS BYTES OF THESE TWO INSTRUCTIONS ARE CONCATENATED AND PLACED 16 BITS PARALLEL INTO MPCR AND AT THE SAME TIME THE LEAST PREVIOUS CONTENTS OF MPCR ARE INCREMENTED AND PLACED INTO AMPCR AS A RETURN ADDRESS.

IF THE WIDTH OF AMPCR AND MPCR IS NOT GREATER THAN 8 BITS, A CALL OR GOTO NEED NOT BE PRECEDED BY A LIT-TO-IR INSTRUCTION.

3.2,2,3

GOTO

A GOTO INSTRUCTION OF GREATER THAN 8 BITS IS ACCOMPLISHED BY TWO SUCCESSIVE INSTRUCTIONS NAMELY: (1) LIT-TO-IR AND (2) GOTO. THE ADDRESS BYTES OF THE TWO INSTRUCTIONS ARE CONCATENATED AND PLACED 16 BITS PARALLEL INTO THE MPCR. THE CONTENTS OF AMPCR ARE NOT CHANGED.

3.2,2,4

LIT TO R

--- --

THE LIT-TO-R (LITERAL TO R-REGISTER) INSTRUCTION IS DECODED WHEN BITS 9 THROUGH 12 EQUAL BINARY 1011 RESPECTIVELY. THIS WILL RESULT IN INSTRUCTION REGISTER BITS 1 TO 8 TO BE PARALLEL TRANSFERRED INTO THE R REGISTER. MPCR IS INCREMENTED AND THE INSTRUCTION IS COMPLETE.

3.3

LOGIC UNIT INSTRUCTIONS (LUOP)

A LUOP INSTRUCTION IS DECODED WHEN INSTRUCTION REGISTER BITS 11 AND 12 ARE A BINARY 0 AND 1 RESPECTIVELY. A LUOP WILL ALWAYS RESULT IN A "STEP" (MPCR INCREMENT); NO OTHER SUCCESSOR IS POSSIBLE. PARS. 3.3,1 AND 3.3,2 GIVE THE FORMATS AND DEFINITIONS OF THE INSTRUCTION REGISTER BITS.

INSTRUCTION REGISTER BITS

[illegible]

* Z = AMPCR. WHEN AMPCR IS NOT SELECTED AS A DESTINATION, THEN AMPCR WILL BE "ZERO" (I.E., $Z = 0$) IN ALL OPERATIONS AS A Y-SELECT INPUT.

@ Y-SELECT = B OR Z AS INDICATED.

"BEX" INDICATES SERIAL TRANSFER FROM EXTERNAL REGISTER TO B-REGISTER WHILE ADDER TRANSFERS TO OTHER SPECIFIED REGISTER (IF B, THEN 2 INPUTS ARE ORED).

x "S" INDICATES A ONE-BIT RIGHT SHIFT OF THE DESTINATION REGISTER END OFF, WITH THE MSB BEING FILLED BY THE ADDER OUTPUT.

3.3.2

FORMAT DEFINITION

THE LOGIC UNIT INSTRUCTION SPECIFIES THE ADDER INPUTS, THE OPERATION, AND THE DESTINATION SPECIFICATIONS FOR THE ADDER. THE X-SELECT TO THE INPUT OF THE ADDER IS EITHER NONE OR ONE OF THE THREE A-REGISTERS (SPECIFIED BY BITS 1, 2). THE OPERATION AND Y-SELECT TO THE INPUT OF THE ADDER ARE SPECIFIED BY BITS 3, 4, 5, AND 6 AND INCLUDE BOTH ARITHMETIC AND LOGIC OPERATIONS ON BOTH THE AMPCR AND B-REGISTER AS INDICATED. THE DESTINATIONS OF THE ADDER OUTPUT AS SHOWN ARE SPECIFIED BY BITS 7, 8, 9, AND 10. THE OUTPUT OF THE ADDER CAN GO TO B, A1, A2, OR A3. THE ADDER OUTPUT ALWAYS GOES TO THE EXTERNAL INTERFACE WHEN A LOGIC OPERATION IS SELECTED, BUT IF ANY "OUT" IS SELECTED AS A DESTINATION, THEN A SPECIAL 4-BIT CODE IS GENERATED ON THE EXTERNAL CONTROL LINES TO ENABLE GATING FROM THE ADDER TO THE PARTICULAR EXTERNAL REGISTER. OF COURSE, THIS IS TRUE ONLY IF THE EXTERNAL INTERFACE IS DESIGNED TO PERFORM THIS FUNCTION. NOTE THAT IF ANY OF THE "BEX" DESTINATIONS ARE SELECTED, A 4-BIT SELECTION CODE IS SENT OUT ON THE EXTERNAL CONTROL LINES THUS ENABLING AN 8-BIT SERIAL TRANSFER FROM THE SELECTED EXTERNAL REGISTER TO THE B-REGISTER TO TAKE PLACE IN PARALLEL WITH THE ADDER OUTPUT INTO THE SPECIFIED REGISTER (I.E., A1, A2, A3, R). IF THE DESTINATION REGISTER IS "B, BEX", THEN AN "OR" OF THE ADDER OUTPUT AND THE EXTERNAL INPUT IS PERFORMED. NORMALLY, THE ADDER OUTPUT IN THIS CASE WOULD BE SET TO TRANSFER ZEROS FROM THE ADDER, THEREBY ALLOWING A SIMPLE EXTERNAL LOAD OF THE B-REGISTER.

AS NOTED BY "*", IF THE AMPCR IS NOT SELECTED AS THE DESTINATION REGISTER, THEN THE FOUR OPERATIONS USING AMPCR AS A Y-SELECT WILL HAVE "ZERO" FOR A Y-INPUT. THIS MEANS OPERATIONS USING AMPCR AS A Y-SELECT CAN ONLY BE TRANSFERRED BACK TO AMPCR OR A3. THROUGH THE USE OF THIS FEATURE "0", "0-NOT", "X", AND "X-NOT" CAN BE TRANSFERRED TO ANY DESTINATION REGISTER EXCEPT THE AMPCR.

THE DESTINATIONS WITH "S" (FOR SHIFT) ALLOW THE DESTINATIONS TO BE SHIFTED RIGHT END-OFF BY ONE BIT, AND THE MOST SIGNIFICANT BIT IS SUPPLIED BY THE ADDER OPERATING ON THE LEAST SIGNIFICANT BIT OF THE "X" AND "Y" SELECTED OPERANDS. IT SHOULD BE NOTED THAT THE ADDER OPERATION IS PERFORMED ON ALL EIGHT BITS OF THE INPUT OPERANDS; THE ADDER CONDITION BITS (LST, MST, ABT, ADV) ARE SET ACCORDINGLY.

IF ONE WISHES TO PERFORM A RIGHT SHIFT (END-OFF) OF ONE BIT ON THE "B" DESTINATION, THEN SELECT (X=0, X+B, B S) FOR THE INSTRUCTION. THE PRIMARY PURPOSE OF THE SHIFT OF THE DESTINATION IS TO ACHIEVE RIGHT AND CIRCULAR SHIFTS ON A1, A2, AND R, BUT ALL OTHER ALLOWED FUNCTIONS ARE VALID INTO THE DESTINATION'S MOST SIGNIFICANT BIT. IF THE (X=A1, X+B, A1 S) INSTRUCTION IS USED, THE ADDITION TAKES PLACE ON BIT 8 OF BOTH "A" AND "B", AND THE RESULTING BIT IS PLACED INTO BIT 1 (MSB) OF A1; THEREAFTER, BIT 7 (LSB+1) OF A1 IS ADDED TO ALL BITS OF "B", AND THE SIDE EFFECTS

3.3.2 (CONTINUED)

FORMAT DEFINITION -----

ON THE ADDER CONDITION BITS RESULT ACCORDINGLY, THE LAST NOTE-WORTHY SIDE EFFECT OF A SERIAL IMPLEMENTATION OF THE ADDER IS THAT THE ADDER OVERFLOW (AOV) CONDITION IS ACTUALLY THE INITIAL AND INTERMEDIATE CARRY FLIP-FLOP FOR THE SERIAL ADDER, AS SUCH, WHENEVER A "+1" OPERATION IS CALLED FOR, THE INITIAL CARRY IS SET. IN FACT, THE INITIAL CARRY IS SET WHENEVER BIT 6 OF THE OPERATION AND Y-SELECT FIELD IS ZERO, HOWEVER, THE INITIAL CARRY FLIP-FLOP IS ENABLED FOR INTERMEDIATE CARRIES ONLY ON ARITHMETIC FUNCTIONS. FOR EXAMPLE, ON AN "X OR R" OPERATION, BIT 6 IS ZERO, THEREFORE "AOV" IS SET AND REMAINS SET UNTIL A SUBSEQUENT LOGIC UNIT OPERATION CHANGES IT.

3.4

CONDITION TEST (CTOP) INSTRUCTIONS -----

A CTOP IS DECODED WHEN INSTRUCTION REGISTER BITS 10, 11, AND 12 ARE ALL ONES. THE REMAINING BITS (1 THROUGH 9) ARE DECODED AS FOLLOWS:

CTOP BITS -----	FUNCTION -----
1-3	SELECTS THE CONDITION TO BE SELECTED,
4-5	CONTROLS THE SET OPERATION OF THE LOCAL CONDITION FLIP-FLOPS,
6-7	SELECTS THE SUCCESSOR (STEP, JUMP, SKIP2, OR EXEC) IF SELECTED CONDITION IS TRUE,
8-9	SELECTS THE SUCCESSOR (STEP, JUMP, SKIP2, OR EXEC) IF SELECTED CONDITION IS FALSE,

3.4.1

CONDITION SELECT -----

THE FOLLOWING IS A BRIEF DESCRIPTION OF EACH OF THE SELECTABLE CONDITIONS.

3.4.1.1

MST, AOV, LST, ABT

THESE CONDITIONS REFLECT THE RESULTS (ADDER OUTPUT) OF THE LAST LUOP:

MST - MOST SIGNIFICANT BIT WAS TRUE.

AOV - ADDER OVERFLOW (MOST SIGNIFICANT CARRY).

LST - LEAST SIGNIFICANT BIT WAS TRUE.

ABT - ALL BITS TRUE (ADDER RESULT WAS ALL ONES).

3.4.1.2

LC1, LC2, LC3

THESE ARE LOCAL CONDITION FLAGS THAT ARE SET BY PROGRAM CONTROL (PAR. 3.4.2) AND ARE RESET WHEN TESTED.

3.4.2

LOCAL CONDITIONS SET CONTROL

AS DESCRIBED IN PAR. 3.4, THE SET FUNCTION FOR LOCAL CONDITION FLIP-FLOPS IS CONTROLLED BY INSTRUCTION BITS 4 AND 5 OF A CTOP. THE SET FUNCTION SPECIFIED BY BITS 4 AND 5 WILL ONLY OCCUR IF THE TEST CONDITION SELECTED BY BITS 1, 2, AND 3 IS TRUE.

EXAMPLE 1: IF LC1 THEN SET LC1 SKIP ELSE JUMP.
THIS INSTRUCTION WILL NOT CHANGE THE STATE OF LC1. IF IT IS SET IT WILL REMAIN SET, IF LC1 IS NOT SET, IT WILL REMAIN RESET.

EXAMPLE 2: IF LC1 THEN STEP ELSE SKIP.
THIS INSTRUCTION WILL ALWAYS RESET LC1 AFTER TESTING IT.

EXAMPLE 3: IF MST THEN SET LC1 STEP ELSE STEP.
THIS INSTRUCTION WILL SET LC1 IF MST = 1; OTHERWISE LC1 WILL BE LEFT UNCHANGED.

3.4.3

SUCCESSOR SELECT

SUCCESSOR SELECTION IS SPECIFIED BY INSTRUCTION BITS 6, 7, 8, AND 9 OF A CROP. BITS 6 AND 7 SPECIFY THE SUCCESSOR IF THE CONDITION SELECTED BY BITS 1, 2, AND 3 IS TRUE; HOWEVER, IF THE SELECTED CONDITION IS FALSE, THEN BITS 8 AND 9 WILL SPECIFY THE SUCCESSOR. AN UNCONDITIONAL SUCCESSOR IS SPECIFIED BY SELECTING THE SAME SUCCESSOR FOR THE TRUE AND FALSE CONDITION. THE POSSIBLE SUCCESSOR SELECTIONS ARE:

3.4.3.1

STEP

MPCR IS INCREMENTED THUS THE NEXT INSTRUCTION WILL BE FETCHED FROM THE MICRO PROGRAM MEMORY AT THE NEXT SEQUENTIAL ADDRESS,

3.4.3.2

JUMP

A COPY OF THE CONTENTS OF AMPCR IS LOADED INTO MPCR, THE PREVIOUS CONTENTS OF MPCR IS DISCARDED. THUS THE NEXT INSTRUCTION FETCHED FROM THE MICRO PROGRAM MEMORY WILL BE AT THE ADDRESS SPECIFIED BY MPCR, WHICH NOW IS THE SAME AS AMPCR,

3.4.3.3

SKIP

FOR 87+ MACHINES WHERE MPCR AND AMPCR ARE ONLY 8 BITS WIDE, MPCR IS INCREMENTED TWICE, THUS THE NEXT INSTRUCTION IS FETCHED FROM THE MICRO PROGRAM MEMORY AT THE CURRENT ADDRESS + 2,

FOR 87+ MACHINES WHERE MPCR AND AMPCR ARE GREATER THAN 8 BITS WIDE. "SKIP" WILL BE MODIFIED BY ADDING A JUMPER WIRE. THIS MODIFICATION WILL CAUSE MPCR TO BE INCREMENTED THREE TIMES AND THEREFORE THE NEXT INSTRUCTION FETCHED FROM MICRO PROGRAM MEMORY WILL BE FROM THE CURRENT ADDRESS + 3. THIS FEATURE ALLOWS SKIP-PING OVER THE NEXT TWO INSTRUCTIONS. A TWO-INSTRUCTION "SKIP" IS REQUIRED BECAUSE "GOTO" AND "CALL" FUNCTIONS REQUIRE TWO SUCCESSIVE INSTRUCTIONS WHEN AMPCR AND MPCR ARE GREATER THAN 8 BITS WIDE.

3,4,3,4

EXECUTE

THE "EXECUTE" SUCCESSOR IS USED TO PERFORM ONE INSTRUCTION (SPECIFIED BY AMPCR) OUT OF SEQUENCE. "EXECUTE" REQUIRES TWO INSTRUCTION PERIODS FOR COMPLETION. THE FIRST INSTRUCTION PERIOD WILL INCREMENT MPCR, SWAP THE CONTENTS OF AMPCR AND MPCR, AND THEN FETCH THE INSTRUCTION PER MPCR (ORIGINALLY AMPCR). THE SECOND INSTRUCTION PERIOD WILL EXECUTE THE INSTRUCTION FETCHED ABOVE, INCREMENT MPCR, AGAIN SWAP THE CONTENTS OF AMPCR AND MPCR, AND FETCH THE INSTRUCTION SPECIFIED BY MPCR.

IN SUMMARY, AN "EXECUTE" WILL PERFORM THE INSTRUCTION SPECIFIED BY AMPCR AND INCREMENT BOTH AMPCR AND MPCR.

APPENDIX B
MDMPL INSTRUCTION LIST

Appendix B. MDMPL Instruction List

This appendix provides a list of MDMPL instructions.

MINI-D INSTRUCTION LIST 2-23-73.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This publication is the Software Maintenance Manual for the Exploratory Systems Control Model (ESM). The software described is contained on four system tapes. Book 1 contains description, flowcharts, and listings for programs written in FORTRAN. Book 2 contains description, flowcharts, and listings for programs written in MDMPL Assemble Language. This manual was prepared by the Burroughs Corporation and is submitted in accordance with the requirements of contract DCA 100-75-C-0054.
